Hello,

The Tieton is currently stationed at transect 7 (east), collecting ethyl benzene sample at 3.3ft of water depth (above mudline). For the east and west banks, water depth was approximately 6ft deep, and thus one 3L pereri-pump sample was collected, and one 30L high volume sample was collected at each bank. The channel is approximately 100ft deep, thus 3 sample intervals will be collected in the Nav channel.

Thanks,

Jonni
